

Assumptions & choices:

A route is unique by the triplet **arrival**, **departure** and **year**. A route id was added to easily connect with the table `Weekly_schedule`.

A weekday is unique by the pair *day* and **year**, so that weekdays for different years can be created with different weekday factors.

The weekly schedule uses a pair of weekday and year to get the correct `weekday_factor` in `weekday`.

A passenger is unique with its passport number and reservation number as a pair. A ticket is connected to a passenger with the same pair. We have chosen to make the assumption that a passenger is not unique only by its passport number, but also together with the reservation. As it looks when checking the `addPassenger()` procedure a passenger will be added after a reservation is created and together with the reservation number.
